## Our Solar System: The Planets and the Sun

Our solar system is a fascinating place with many planets and the sun at its center. The sun is like a big, bright ball of light in the sky. It gives us light and warmth, and without it, we wouldn't be able to live on Earth.

There are eight planets in our solar system. They are Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, and Neptune. Each planet is unique and has its own special features. Some are rocky like Earth, while others are big gas giants with no solid surface.

The planets move around the sun in different paths called orbits. Earth is one of the planets, and it is where we live. Our solar system is so big that it would take a very long time to travel from one end to the other. But thanks to our amazing technology, we can learn more and more about this vast and mysterious space.

### Questions:

1-What is at the center of our solar system?

---

2-What does the sun provide us with?

---

3-How many planets are there in our solar system?

---

4-Can you name three planets in our solar system?

---

5-Which planet is Earth ,and what is special about it?

---
