How Do Bees Make Honey?

Buzz, buzz! Imagine following a bee on a sunny day. Bees fly from flower to flower, drinking sweet nectar. They take the nectar back to their hive, where many other bees are busy working.

Inside the hive, the bees turn the nectar into honey by fanning their wings to make the water dry out. When the honey is ready, they store it in tiny wax rooms called honeycombs. This is where we get the delicious honey we eat on toast or in tea!

Bees are very important because they help plants grow by moving pollen from one flower to another. Without bees, we wouldn't have many of the fruits and vegetables we eat.

Answer the following questions.

1-What do bees collect from flowers?

2-Where do bees take the nectar after they collect it?

3-How do bees turn nectar into honey?

4-What is a honey comb?

5-Why are bees important for people and plants?
