What is A Rainforest?

Rainforests are warm, wet places filled with plants and animals. The tall trees create a roof called a canopy, where monkeys, birds, and insects live. On the forest floor, you can find jaguars, snakes, and many colorful frogs. Rainforests are important because they give us oxygen and many kinds of medicine. Scientists work hard to protect rainforests so animals and plants can stay safe.

Answer the following questions.

1-What is the "canopy" in a rainforest?

2-Name two animals that live on the forest floor.

3-Why are rainforests important for humans?

4-What do scientists do to help the rainforest?

5-Describe one thing you learned about rainforests from this passage.
