

Name:

Types Of Animal Habitats

An animal habitat is the natural place where an animal lives. Habitats provide animals with the things they need to survive, such as food, water, shelter, and space. Different animals are adapted to live in different habitats. There are many types of habitats on Earth, including forests, deserts, oceans, grasslands, and polar regions.

1. Forests:

Forests are home to many animals like tigers, monkeys, birds, and insects. Trees provide shelter and food, and the dense plants help protect animals from predators. Forests also have rivers and streams that provide water.

2. Deserts:

Deserts are dry areas with very little rainfall. Animals such as camels, lizards, and scorpions are adapted to survive with little water. Many desert animals are active at night to avoid the heat of the day.

3. Oceans:

Oceans are vast bodies of saltwater that cover most of the Earth. Marine animals include fish, whales, sharks, turtles, and dolphins. Many ocean animals live near coral reefs, which provide food and protection.

4. Grasslands:

Grasslands are open areas with many grasses and few trees. Animals like lions, zebras, elephants, and giraffes live here. Grasslands provide animals with space to roam and plenty of plants to eat.

5. Polar Regions:

Polar regions are very cold and icy, such as the Arctic and Antarctic. Animals like penguins, polar bears, seals, and arctic foxes have thick fur or blubber to keep warm. These habitats are challenging, but animals have adapted to survive in extreme cold.

Every habitat is important because animals and plants depend on them to survive. If habitats are destroyed, animals may become endangered or extinct. Humans can help protect habitats by planting trees, cleaning rivers, reducing pollution, and respecting wildlife.

Name:

Types Of Animal Habitats

A. Multiple Choice (Choose the correct answer):

What is an animal habitat?

- a) A place where humans live
- b) A natural place where an animal lives
- c) A zoo
- d) A farm

Which animals live in forests?

- a) Camels and lizards
- b) Tigers and monkeys
- c) Penguins and seals
- d) Lions and zebras

Why are many desert animals active at night?

- a) To find more food
- b) To avoid the heat of the day
- c) To see better
- d) To play

What helps ocean animals like fish and turtles survive?

- a) Forests
- b) Coral reefs
- c) Sand dunes
- d) Grasslands

B. True or False:

- 5. Grasslands have many trees and few grasses. _____
- 6. Polar animals have special adaptations like thick fur or blubber. _____
- 7. Destroying habitats can put animals in danger. _____

Name:

Types Of Animal Habitats

8. Name two animals that live in deserts.

9. Why are coral reefs important for ocean animals?

10. Give one example of how humans can protect habitats.

11. Name one adaptation that helps polar animals survive the cold.

12. List three things habitats provide animals to survive.
