

All About Horses

Horses are strong and graceful animals that have been friends with humans for thousands of years. They live in many parts of the world, especially on farms, grasslands, and open plains. Horses have long legs and strong bodies that help them run fast. Their hooves make a loud sound when they run, which people call “clipping.” Horses come in many colors, including brown, black, white, gray, and spotted patterns.

Horses are herbivores, which means they eat only plants. They like to eat grass, hay, grains, and sometimes fruits and vegetables. Horses use their teeth to chew their food carefully. They are social animals and enjoy living in groups called herds. Horses communicate with each other through sounds, movements, and expressions.

Baby horses are called foals. Foals can stand and walk within a few hours after they are born. They stay close to their mothers for safety and learn important skills, like running and eating solid food. Horses are gentle and intelligent animals. They have been used for riding, farming, and carrying loads, but they also enjoy running freely in open spaces.

Horses face some dangers from humans and the environment. They need protection from bad weather, predators, and overwork. Farmers, wildlife parks, and animal welfare groups help take care of horses and keep them safe. Protecting horses ensures that these beautiful animals continue to live happily and healthily.

Where do horses mostly live?

What do horses eat?

What are baby horses called?

How do horses communicate with each other?

Why do horses need protection today?

True or False :

Horses are herbivores.

Baby horses are called calves.
