

All About Eagles

Eagles are large and powerful birds known for their sharp eyes and strong wings. They live in many parts of the world, including mountains, forests, and near rivers. Eagles are famous for their excellent eyesight, which helps them spot prey from far away while flying high in the sky. They are top predators, which means they hunt other animals to eat.

Eagles have strong, hooked beaks that help them tear meat easily. Their sharp talons, or claws, help them catch and hold their prey.

Eagles eat mostly fish, small mammals, and other birds. They are very fast and can swoop down quickly to catch their food. Eagles often build large nests called eyries in tall trees or on cliffs, where they lay eggs and raise their young.

Baby eagles are called chicks. They stay in the nest until they are strong enough to fly and hunt for themselves. Eagles are careful parents and take turns hunting and keeping their chicks safe. They are symbols of strength and freedom in many cultures around the world.

Eagles face dangers from humans and the environment. People sometimes destroy their nests or hunt them for feathers. Pollution and loss of habitat also make life harder for eagles. Conservation groups work to protect eagles by creating safe habitats and teaching people how to keep them safe. Protecting eagles helps keep nature balanced and healthy.

What helps eagles spot prey from far away?

What are eagle babies called?

What do eagles eat?

Where do eagles usually build their nests?

Why do eagles need protection today?

True or False :

Eagles are known for their sharp eyesight and strong wings.

Baby eagles are called chicks.

Eagles eat mostly grass and plants.

Eagles build nests called eyries in tall trees or cliffs.

Conservation groups help protect eagles and their habitats.
